What Do the People Want?

Opinions, Moods and Preferences of European Citizens
What Do the People Want?

Opinions, Moods and Preferences of European Citizens

Catherine E. de Vries & Isabell Hoffmann
Description

The Eurozone crisis has pushed reform of the European Union (EU) to the forefront of political debate. How can a Union of 28 states with a population of over half a billion be reformed to weather future economic crises and political challenges? Finding an answer to this question is extremely difficult not only because current reform proposals are so varied, but even more so because we lack insights into the preferences for reform amongst national elites and publics. Although EU support has interested scholars for over three decades now, we virtually know nothing about public support for EU reform. Current research focuses almost exclusively on the causes of support for the current project and fails to provide a sufficient basis for effective reform decisions. Surely, the feasibility and sustainability of EU reform crucially hinges on the support amongst national publics. In this report, we examine public support for EU reform by developing a theoretical model and employing cutting-edge data collection techniques. Our findings will aid policy makers to craft EU reform proposals that can secure widespread public support. We aim to meet this objectives by crafting a novel multidimensional model, which posits that support for EU reform consists of four dimensions: a functional, communal, utilitarian and institutional dimension, and employing novel data collection techniques, such as a conjoint experiment.

</table>
When we look at recent elections in the EU and its member states, we see decreasing voter participation and growing support for “EU sceptical” parties. This could be interpreted as a sign of mistrust in European governments in general or for the EU in particular. In turbulent times, pressing issues like security, employment and migration make strong collective action and integration necessary. Yet the inability to deliver results to EU citizens leads to doubts about the Union. EU member state leaders like Chancellor Merkel, President Hollande, and Prime Minister Cameron differ openly about whether there should be more or less integration.

A question seldom asked is: Where do European citizens stand when it comes to more or less integration?

While academic and political studies about support for European integration are abundant, we lack data about what the people think about EU reform. Would they prefer a smaller union? One that is less cost effective but cares about social inequality and has an elected President at its top? Or do they prefer a larger one with a focus on foreign policy?

The Bertelsmann Stiftung has always been strongly in favour of European integration. We believe that we need a functional EU that is politically and economically strong. But we also believe in a democratic Union that appeals to its citizens. Any EU reform has to take their preferences into consideration if it does not wish to share the fate of the constitutional treaty. This study—a conjoint experiment embedded in a survey representative in the EU28—is the first in a series. Our EUpinions shed a light on the moods, preferences, and resistance of European citizens when it comes to European integration and will aid policymakers to craft EU reform proposals that can secure widespread public support.

Executive Summary

The Eurozone crisis has proven to be a stress test for the European Union. While recovery may be on its way, the recession has left a mark on public opinion. Feelings of discontent and anger over Brussels’ response to economic downturn and the influx of refugees seems to have caused public support for the European project to plummet to an all-time low. This, at least, is the popular perception portrayed in media reports and commentary. But, is it really the case that Euroscepticism has become the norm in 2015?

This report suggests that caution is in order. Our research demonstrates that public support for the EU is ambivalent, and that knowledge about the EU is quite high, in fact higher than documented prior to the crisis. Yet to know the European institutions and its politicians does not mean to love them. While a majority of citizens support their country’s membership in the Union and within the Eurozone membership in the Euro, they are not satisfied with policy direction in the EU. What is more, while a large majority favours further political and economic integration, the same respondents say that they espouse negative views about the EU when talking to friends. This seems to suggest that they are conflicted. Put simply, people support the idea of an united Europe, but are increasingly weary about its current direction.

Interestingly, we do not find that the nation state is seen as the alternative, quite the contrary. Europe’s citizens may be dissatisfied about the current state of affairs in Brussels, but they are equally unhappy with the situation in their national capitals. The only clear exception to this pattern is Great Britain. The study relies on survey data and an embedded experiment done in July 2015 that covers public opinion in the EU28 as well as an in-depth look into opinion in the six largest member states.

What Stands Out About EU Citizens’ European Preferences?

1. Support for membership is high throughout the Union (71%). It is lowest in Great Britain (59%) where, nevertheless, a majority — in July 2015 — would have voted for EU membership in a referendum.

2. A majority of people in the Eurozone support the Euro (63%), and support for the Euro is equally high in southern member states, even though these populations were hardest hit by the Eurozone crisis. That said, citizens in non-Eurozone countries strongly oppose the Euro (85%), and support for the Euro is lowest in Great Britain (14%).
3. On average, people in the EU favour more political and economic integration in the future (59%). But this support is slightly higher in countries that are part of the Eurozone (64%). It is especially high in the southern member states (71%). The fact that southern member states are on average more supportive of integration is interesting as they have experienced the adverse effects of the Eurozone crisis and have had to suffer controversial austerity policies as a result.

4. Contrary to findings in the past, citizens in Europe today, and especially those in the Eurozone, are much more knowledgeable about the EU. 68% of EU citizens and 74% of the citizens in the Eurozone display a high knowledge about European affairs. Europeans are also more familiar with the leading figures in the EU. Even though national leaders receive the highest recognition rates (Merkel 82%, Cameron 74%, Hollande 62%), their European counterparts score surprisingly high. More Europeans have heard of Jean-Claude Juncker and Martin Schulz (both 40%), Donald Tusk (34%) and Mario Draghi (34%) than of Matteo Renzi (32%) or Mariano Rajoy (23%). Again, Britain is the exception with more people having low (52%) rather than high knowledge (48%), and with significantly fewer people familiar with key European actors.

5. While support for the European regime (measured by support for membership and within the Eurozone support of the Euro) is high, policy support is low. People are on average dissatisfied with the direction that the EU is moving (72%), more so in the South (81%), especially in Italy (89%). That said, people are equally dissatisfied about the policy direction in their own country, less so in Great Britain, Poland and Germany.

6. People see the opening of borders and economic growth as the EU’s biggest achievements, while they view peace and security and the fostering of economic growth as Europe’s biggest policy needs.

7. When asked whether they would speak positively or negatively about the EU to friends, people on average said they were equally likely to do either (53% positive, 47% negative). Yet, people in non-Eurozone countries are more optimistic. This difference is driven primarily by the strong optimism of the citizens in the East. The Danish, British and Swedish are more negative.

8. Europeans are on average positive about German leadership in the Union (55%), although Germany’s role in the South is evaluated quite negatively (60%). Interestingly, the results suggest that the youngest generation of 15 to 25-year-olds in the South hold the most positive views about German leadership (51%).

What Stands Out About Preferences for EU Reform?

1. On average, EU citizens prefer an EU that is not too costly (they don’t mind paying up to €35 per capita a year). They like the EU’s current size. It should be designed predominantly to safeguard peace and security as well as promote economic growth. And they would like to have a say more often through referenda.
2. EU citizens as a whole strongly oppose the idea of a directly elected EU President taking decisions, even citizens that clearly favour more political and economic integration. People are on average largely indifferent about national governments or the European Parliament being the key decision-makers. They are only slightly less enthusiastic about the European Commission taking decisions compared to the European Parliament.

3. Important cross-national differences in EU reform preferences exist. For example, the Spaniards and Poles, currently net recipients of the EU budget, are willing to pay more for the EU in the future while Britons, French, Germans and Italians — all net contributors — are not. Interestingly, the French are equally enthusiastic about the prospect of decisions being taken by a directly elected President rather than the European Parliament, while the British clearly prefer national governments being in control or decisions being made through referenda. Finally, we find differences based on policy preferences: EU citizens in the South and East care significantly about economic growth, while citizens of the North favour a Union dealing primarily with peace and security. The latter view the regulation of immigration as of equal importance to that of growth.

4. Although we find no differences based on gender, EU reform preferences do differ based on age. Generations primarily disagree about who should take decisions in the EU and what policy goals the EU should focus on. In France, Italy, and Spain, for example, younger generations favour decision-making through referenda rather than the European Parliament, while in Germany older generations do. When it comes to policy preferences, we find that both the oldest and youngest generations in the EU favour an EU that safeguards peace and security over one that promotes growth.

5. When it comes to how EU preferences relate to support for EU reform, we find no differences based on the level of EU knowledge. Yet, we do find clear differences based on overall level of scepticism about the EU. Regardless of whether people are sceptical about their country’s membership in the Union, the Euro, further political and economic integration or the overall policy direction, sceptics differ primarily in their views about who ought to take decisions in the Union. In contrast to supporters, sceptics are much more opposed to a Union in which European actors make policy. The type of EU that reform sceptics most want to see is a move towards more national control, either by means of citizen referenda in which national publics decide or through national governments.

6. Next to more intergovernmental decision-making, sceptics also value an EU that regulates immigration more, some even prefer it to one that promotes economic growth.

7. There are, of course, people who are highly supportive of the European Union and its politics. They are much less opposed to European institutions taking decisions for example.
What does this mean for the future of the Union and attempts to reform it?

We maintain that three things are important in this respect. People do support the idea of a united Europe, but are increasingly weary about its current execution. They are largely dissatisfied with many of its current policies, and are keeping a close eye on what is being done. Also, they are much more informed about Europe. Finally, people seem to care deeply about who governs them.

The Eurozone crisis has left a mark on public opinion. We find that contrary to past findings, citizens in Europe today, and especially those in the Eurozone, are much more knowledgeable about the EU. Yet, this higher knowledge does not necessarily lead to more approval. This is an important finding for those who seek to increase support for European integration merely via better communication. Our data reveal a much nuanced picture.

While regime support is high, policy support is not. Hence, a more attentive citizenry makes it even more important for the EU to perform, not only in terms of outcomes but also in terms of its procedures. More than ever, political leaders need to publicly defend what they think is the best way forward in European politics. With the political culture of the EU being far from transparent, political leaders must find a way to openly argue over policy measures without being perceived as dived, nationalistic and incapable of taking decisions.

In any representative system, the procedural aspect is particularly important as individuals rarely get everything they want in terms of policy outputs and outcomes. What counts then is the belief that institutions provide a fair articulation of one’s interests. One reform that most EU citizens agree on in this context is the implementation of referenda. At the same time, they oppose the handover of power to a directly elected President. They clearly prefer a diffusion of power over the concentration of power in Brussels. To implement some element of direct democracy in the institutional setting of the EU might be a fruitful way to let citizens know that they have some control over “what happens in Brussels”.

Overall, these results convey a message of hope for European officials and political actors in the member states. Europeans have not deserted the European project. They generally support the EU, the Euro, and even further political and economic integration. Following closely what is happening at the European level, people today know more than ever before about European politics.

High level of political knowledge and awareness have consequences. People now pay attention to European politics but they are not satisfied with what they see. European political decision-making has clearly given its citizenry an inside look into how difficult it is to craft policies to address the looming societal challenges in all 28 member states. Thus, while system support is high, policy support is not. If elites fail to address discontent over policy outcomes, worries about how decisions are made and the good will may fade. If people feel that their voices are not heard in Brussels, they may turn against the project altogether. Setting aside these concerns may seem tactically beneficial to national governments in the short term, but the long-term consequences may threaten the very existence of the Union.
The Union Needs Reform, But Will the European Public Support It?

The Eurozone and refugee crises have pushed reform of the EU to the forefront of the political agenda. How can a Union of 28 states with a population of over half a billion be reformed to best address future crises and challenges? Finding an answer is extremely difficult: not only because actual reform proposals range from a full-fledged political union to a partial repatriation of powers to nation states, but also because we lack data about the support among the national publics for reform. Ever since the ‘no votes’ in the 2005 referenda on the Constitutional Treaty, leaders in Brussels and national capitals have been faced with a new political reality: the EU is a highly divisive topic among national publics (De Vries, 2007; Kriesi, et al., 2008; Hobolt 2009). Experts are divided, too. Some, such as former Commission economist Paul De Grauwe and Nobel laureate Paul Krugman call for the creation of a political union that would aid the Euro in withstanding economic shocks and secure financial stability in the long run. Yet others, like Council President Donald Tusk, warn that the further of pooling sovereignty at the EU level might provoke a serious backlash by national publics and Eurosceptic political entrepreneurs.

Indeed, the question of what kind of EU reform of the Union is needed and feasible is high on the political agenda. On the 7th of October of this year, the German Chancellor, Angela Merkel, and the French President, Francois Hollande, gave a joint speech in the European Parliament in Strasbourg. They underlined that in their opinion the only way for Europe to take on the many challenges it is facing is to stand united. Whether it is the Euro crisis, the refugee crisis, the wars in Ukraine and Syria or the fight against the global warming. Therefore, they argued, further integration will be needed to approve the functioning of those parts of the EU that have been particularly tested and displayed their weaknesses over recent years. Namely the economic and monetary Union, the Schengen area, and the external policy of the European Union. Meanwhile the European Commission has put forward its vision for a closer economic and monetary Union with the 5-President report in June 2015 and with a action plan to address the refugee crisis later in September. So further reform seems to be inevitable. Yet, only if political leaders in Brussels and across European capitals provide a vision that can be shared by a majority of Europe’s 500-million-strong population, can political and economic reform be sustainable. If EU and national leaders move swiftly to further pool policy and institutional competencies without the backing of the European EU public, this will most likely backfire.
Both pundits and scholars argue that political elites in the past have been so eager to pursue integration that they have lost track of the concerns and desires of citizens. Elites have also failed to persuade citizens of the wisdom of their policies. Instead, many argue, elites have moved ahead with European integration despite insufficient public support, as became painfully evident in recent electoral contests in Brussels and throughout Europe’s national capitals when accusations that political elites are out of touch may often be politically motivated, but these charges demonstrate the importance of understanding public preferences for reform. What kind of reform do the national publics support?

While studies about support for European integration are abundant (see Hobolt 2012, Hobolt and De Vries 2015 for overviews), today we know virtually nothing about EU citizens’ opinion about possible reforms. This is worrisome given that a decade ago attempts to reform the Union through the Constitutional Convention and the Constitutional Treaty failed dramatically to garner support among national publics. Against this backdrop, it is imperative to provide a comprehensive understanding of public support for possible reform of the Union. This report presents the findings of a detailed empirical analysis that does exactly that. Building on and extending current work on public support for European integration, we examined the trade-offs between different aspects of integration. Specifically, we focused on four dimensions of support for EU reform:

1. **The functional dimension:**
   What type of European integration do EU citizens want?

2. **The communal dimension:**
   With whom do EU citizens want this integration?

3. **The utilitarian dimension:**
   How much are EU citizens willing to pay for this integration?

4. **The institutional dimension:**
   How do EU citizens want the European Union to be governed?

These questions capture the key dimensions of support that have been identified by experts, and represent some of the most important trade-offs that citizens face. Yet, they have not until now been systematically examined in the context of possible reform of the Union or in an experimental setting that would allow us to capture their causal impact. The functional dimension relates to the policy that the EU should be promoting. Studies that compare the preferences of elites and ordinary citizens for the policy content of integration are relatively rare, but those that exist show that while elites favour integration in policy areas like trade and finance — citizens would like EU policy-making to concentrate on social policy and employment (Hooghe 2003, Müller et al. 2012). The communal aspect of European integration refers to the political community of the Union. From existing work we know that the degree to which citizens identify with fellow EU citizens from other member states affects the way they evaluate the integration process (McLaren 2002, Hooghe and Marks 2005). The utilitarian dimension signifies the costs that citizens are willing to pay for closer cooperation in Europe and follows from the cost–benefit approach to EU support (Gabel 1998). Finally, the institutional dimension relates to the way decisions are taken in the EU. Following the work that suggests that the democratic deficit affects people’s views of European integration (Rohrschneider 2002), the decision-making procedures in the union should be related to support for EU reform. These four dimensions are at the core of our data collection.
Our Method: A Conjoint Experiment Embedded in a Survey

This study provides the first in-depth examination of public support for diverse EU reform proposals across member states. Specifically, we utilize a novel data collection approach, namely experimental conjoint analysis that originates from marketing and psychology research and was recently adapted to fit questions related to political science (Hainmueller, Hopkins and Yamamoto 2014). It maps out reform proposals that vary in terms of their functional, communal, utilitarian and institutional characteristics — and that have the most support among European citizens. We explore how these characteristics affect public support for EU reform by varying the features of each reform proposal. In other words, the study provides respondents with different combinations of values of the functional, communal, utilitarian and institutional dimensions. Conjoint experiments, which were developed in psychology and marketing, consist of respondents ranking or rating two or more hypothetical choices, in this case reform proposals for the EU. These hypothetical choices have multiple attributes, that is to say they vary on different dimensions. These dimensions are defined by the researcher on the basis of the scholarly literature, and in our case refer to the functional, communal, utilitarian and institutional dimensions outlined above. The objective of the conjoint experimental design is to estimate the influence of each attribute, for example the number of member states in the Union (communal dimension) or the costs of integration per person per year (utilitarian dimension), on the choices and ratings of the respondents. In order to make sure that alternative explanations are addressed, the political scientist Jens Hainmueller and several colleagues (Hainmueller, et al. 2014) have proposed a conjoint method using fully randomized designs.1

Why is a conjoint experimental design most appropriate for examining public support for EU reform? Traditional survey research — upon which our current knowledge of support for European integration is based, including our own work — makes it difficult to trace complex and multidimensional preferences. In addition, it suffers from well-known causal inference problems. Put differently, it is difficult to make any causal claims about the effects of different dimensions on choice using the data that is available given that we do not know in which direction the causal arrow flows. Finally, do opinions reflect real behaviour? Validation studies have shown that conjoint experiments perform remarkably well in predicting real-world behaviour (Hainmueller, et al., 2015). Hence, a conjoint experiment helps us maximize the external validity of our findings. When it comes to multidimensional preferences, a fully randomized conjoint in which survey respondents compare different sets of two possible proposals for EU reform and choose between them, allows us to assess the influence of different features of the proposed reform on how respondents evaluate a given proposal relative to another. One of the advantages of using a fully randomized design — that is randomizing the exact values on the different dimensions that feature on a reform proposal — is that the causal effect of the features of reform proposals on public support are non-parametrically identified. This means that one does not need to rely on assumptions about the functional form that maps reform proposal features on support (see Hainmueller, et al., 2014). The randomization

1 This approach was corroborated in recent work on support for global climate agreements by Bechtel and Scheve (2013) published in the Proceedings of the National Academy of Sciences and work on support for EU bailouts in Germany by Bechtel, et al. (2014) published in the American Journal of Political Science.
also ensures that the treatment groups are comparable with observable and un-
observable confounding factors, that is to say with respect to alternative expla-
nations. For example, respondents might interpret some of the information pro-
vided differently, which could affect the extent to which their support for an EU
reform proposal depends on its specific design features. However, because of the
randomization applied to a large sample any potentially confounding variables
will be distributed uniformly across treatment groups. Therefore, these groups
will remain comparable, which means the estimates of how different reform fea-
tures affect public support for EU integration remain valid even in the presence
of differences in respondents’ subjective interpretations and beliefs.

Table 1 provides an overview of the conjoint experimental design that was used.
In the survey, respondents were shown two hypothetical EU reform proposals in
comparison and asked to choose between them. Each respondent was randomly
assigned four of these binary comparisons of EU reform proposals. Respondents
were presented with a paragraph briefly explaining the task they are about to
complete.

Subsequently, respondents were presented with four binary comparisons of
different reform proposals. For each of the four binary comparisons respondents
were shown a table (see Table 1) displaying two reform proposals. The order in
which the features of the different dimensions were displayed to respondents
was randomized, which circumvents the possibility that the ordering by which
respondents receive the information affects the likelihood of them supporting
particular reform proposals over others. After each table, respondents were
asked which proposal they prefer. In addition, asked to rate each proposal by
answering how likely it is that they would vote for either proposal in a referen-
dum, ranging from not very likely to very likely. Overall, each binary comparison
was comprised of two questions: a choice for one proposal and a rating of each proposal, and each respondent faced four binary comparisons.

Table 2 shows the dimensions, features, and values used in the conjoint experiment. For each reform proposal presented to the respondent, the values for each dimension were assigned randomly. The choice of policy areas draws predominantly on the work by Müller et al. (2012). As the primary policies that the EU should promote we added classical 'European' ones like peace and security as well as economic growth, but also inequality reduction and immigration, which have become salient in current debates on the context of the refugee crisis in the Mediterranean and the Eurozone crisis. In order to operationalize the communal aspect of European integration, the number of member states in the Union was included. This reflects debates about and studies of future enlargements and the EU bailouts that suggest that regional divides are pertinent (Dixon and Fullerton 2014, Bechtel, et al. 2014). To explore the degree to which people are willing to sacrifice income for further integration, the annual net contribution per person per year is added (Anderson and Reichert 1995, Gabel 1998). The cost values are based on the 2009/2011 net contributions to the EU budget ranging from highest in Denmark (€211 per person per year) to lowest in Lithuania (€0 per person per year).

---

2 Johnson and Orme (1996) suggest that in choice-based conjoint modelling one can reduce measurement error by increasing the number of tasks that each respondent completes. In addition, allowing respondents to complete more than one task is desirable as it increases the accuracy of responses through facilitating the understanding of the task involved. Yet, too many choice tasks may become too demanding or even lead to boredom. Following recent work by Bechtel and Scheve (2013), four choice tasks were included which allowed for some learning while not overburdening respondents.
which were publicly available. Finally, based on the discussion about the democratic deficit and governance in the EU (Scharpf 1999, Rohrschneider 2002, Føllesdal and Hix 2006), a feature that inquires into who decides on policy in the EU, is added. This relates to the type of policy-making in the EU and ranges from technocratic governance (decision-making by the European Commission) to direct democracy (decision-making through popular referenda).

Next to the conjoint survey experiment, we also fielded a questionnaire inquiring into attitudes and knowledge of the EU and their national systems. This allowed us to capture the general mood of respondents, put it in a national perspective, and determine how support for different reform proposals might also vary across different respondents. The public opinion data collection was carried out by Dalia Research GmbH using mobile phone applications. The fieldwork was conducted in July 2015 based on a representative sample of citizens from all 28 member states as well as representative samples from the six EU member states with the largest populations: France, Germany, Italy, Poland, Spain and the UK.

Our Findings: What Type of Union Do People Want?

Short Summary

The presentation of the results is divided in two parts. Part I presents an overview of the overall ‘European mood’ of the European citizenry in different regions and in the six largest member states in July 2015. It aims to place this in the context of people’s views about their national systems. The findings show that:

» Contrary to growing media reports and common opinion, Europe’s citizens can by no means be classified as Euroceptsics, but rather have ambivalent attitudes towards Europe (see also De Vries and Steenbergen 2013).

» While a majority of people, even in the bailout-battered South, support their country’s membership in the Union and in the Eurozone, they are not satisfied with the EU’s current policy direction.

» Moreover, we find that while a large majority favours further political and economic integration in Europe, at the same time Europeans would be equally likely to express negative views about the EU than positive ones when talking to friends. This seems to suggest that while people support the idea of a united Europe, they are increasingly weary about its current governance.

» The only part of the Union that is perhaps best classified as Eurosceptic is Great Britain.

» Finally, our results indicate that even if Europe’s citizens are dissatisfied with the current state of affairs in Brussels, they are equally unhappy with the situation in their national capitals.

Part II presents an overview of the findings based on our conjoint experiment. Against the backdrop of our main finding—that a majority of the European
citizenry supports membership and further integration, yet is dissatisfied about the current state of affairs — it is pertinent to explore what kind of Union people would support in the future. We explored how costs, different decision-making institutions, the number of member states, and the policy goals pursued affect support for EU reform proposals.

We find that:

» Two changes to the current status quo are particularly popular among EU citizens: The use of referenda as a means of decision-making in the EU, and a Union that focuses on peace and security issues. In addition, people are indifferent about raising the average contribution to €35 in the EU compared to the current level of €0 per capita, but would not like to pay much more than that. They are strongly opposed to the notion of an elected European President taking decisions. Of all of the European actors, they prefer the European Parliament taking decisions. In terms of size, they favour the status quo of 28 member states. Finally, next to security and peace, people prefer an EU promoting economic growth rather than other policy goals such as securing energy safety, combatting climate change or regulating immigration.

» Yet, key regional and individual level differences exist. They relate mainly to people’s views about who ought to make decisions in the Union and what should be the EU’s core policies. For example, in the case of how decisions are made in the EU, the French are largely indifferent about EU decision-making via a directly elected President or the European Parliament, most likely because they have a President at home. Yet the British and overall more Eurosceptic citizens in other member states prefer a Union in which decision-making takes place via national governments or referenda, not through European institutions like the European Parliament or Commission.

» Finally, we find that EU reform preferences differ based on age. Generations primarily disagree about who should take decisions in the EU and what policy goals the EU should focus on. In France, Italy and Spain, for example, younger generations favour decision-making via referenda rather than the European Parliament, while in Germany it is older generations that do. When it comes to policy preferences, we find that both the oldest and youngest generations favour an EU that safeguards peace and security over one that promotes growth.
Let us first explore whether European citizens have a modicum of knowledge about the EU that would then allow us to delve deeper into their attitudes towards different aspects of the EU, such as EU membership, the Euro and preference for further political and economic integration. It is well established that voters differ with regard to their cognitive capacities and knowledge about politics (Converse 1964, Zaller 1992, Delli Carpini and Keeter 1996). In the literature on public support for European integration, a debate exists about citizens’ ability to form “real” opinions about the European integration process. It has been traditionally argued that European integration is one of the most complex political issues that European publics face, and that much of the day-to-day debate involves highly technical questions that citizens may find difficult to grasp (see for example Anderson 1998). The EU for much of its history was presented to citizens as a matter of foreign policy, about which citizens tended to have little knowledge (Holsti 1992, Karp, Banducci and Bowler 2003, De Vries et al. 2011). This was long supported by survey evidence. For example, results from the European Election Study in 1999 suggest that more than three-quarters of European citizens did not feel sufficiently informed about the politics of the EU. Yet, by 2014 the survey found that over 65 percent of European citizens were able to correctly answer at least one of two “EU knowledge questions” concerning membership of Switzerland in the Union and a procedural aspect of European Parliament elections. Our survey results underscore this finding, and suggest that by 2015 people have in fact become quite
knowledgeable about the EU and know some of the key EU officials like Commissio-

Figure 1 displays the percentage of people who were able to correctly answer at least one of two factual knowledge questions about the EU. The first question asks whether Switzerland was a member of the EU, and the second question asks whether all member states have the same number of parliamentarians in the European Parliament. A clear majority — 68 percent of people — answered at least one of these questions correctly. This is considerable and suggests that knowledge about EU affairs by 2015 is quite high. This slightly higher level of knowledge than reported in the European Election Surveys of the late 1990s or early 2000s is perhaps a by-product of the Eurozone crisis that has brought EU affairs to the forefront of political debate and media coverage.

To explore whether the Eurozone crisis indeed increased the salience of EU affairs in the minds of ordinary people and made them pay closer attention and become informed, we explore differences between the Eurozone and non-Eurozone countries. If the Eurozone crisis at least partially contributed to information being more readily available, we ought to find that knowledge about the EU is higher in countries that are part of the Eurozone and thus more affected by the crisis compared to non-Eurozone countries. Figure 2 below suggests that this is the case: When evaluated by answering at least one of the two factual knowledge questions correctly, 74 percent of citizens in the Eurozone did so compared to just 56 percent in non-Eurozone countries.

The inspection of regional differences in Figure 3 confirms this further. In the North non-Eurozone region, including Denmark, Great Britain and Sweden, we find an equal amount of people who have low compared to high levels of knowledge. In the East, where the Baltic states, Slovakia, and Slovenia have joined the Euro, but other countries like Bulgaria, the Czech Republic, Hungary and Poland for example have not, the gap between high and low EU knowledge is narrower, than in the North Eurozone or the South. This seems to indicate that knowledge about the EU is higher in regions that have the Euro and thus were most affected by the crisis, either as creditors or debtors.
Figure 4 below plots the proportion of people with high and low knowledge about the EU in the six largest member states. Again, knowledge is highest in countries that have adopted the Euro: France, Germany, Italy and Spain; and lower in the non–Eurozone countries: Great Britain and Poland. Interestingly, in one country, Great Britain, the proportion of people displaying low knowledge about the EU with 52 percent actually exceeds that of high knowledge (48 percent), although this gap is small. This low level of knowledge about the EU means that politicians and journalists may have significant room for explaining and molding public opinion in the upcoming Brexit referendum.

Our finding that knowledge about the EU is fairly high, yet not equally distributed across the Union, is further confirmed when we inspect the name recognition of key EU officials and compare those to national heads of state. Providing this national yardstick is important and it puts our findings in a comparative context. Perhaps people by 2015 are indeed quite informed about the EU, but still much less so compared to their national systems. We explore this possibility by focusing on two questions in our survey where we ask respondents whether they have heard of the following sets of names:

1. Angela Merkel, François Hollande, David Cameron, Barack Obama, Ewa Kopacz, Mariano Rajoy, Matteo Renzi, Alexis Tsipras.
2. Martin Schulz, Jean-Claude Juncker, Mario Draghi, Jeroen Dijsselbloem, Donald Tusk.

Figures 5.1 and 5.2 provide an overview of the name recognition of national heads of state and EU officials across all 28 member states. Not surprisingly, nearly all people recognize the names of the US President Barack Obama and German Chancellor Merkel, and a considerable amount of people have heard of the British Prime Minister David Cameron and the French President François Hollande. The national heads of state of Southern and East European countries, specifically Spain, Italy, Greece, and Poland, are far less known — with the exception of Greece’s Alexis Tsipras. Given that in the time frame of investigation, July 2015, the Greek bailout talks were in full force, the name recognition of Tsipras should not come as a surprise. Yet, it is perhaps surprising to see that a considerable share of people know the European Parliament President Martin Schulz, Commission President Jean-Claude Juncker, the ECB President Mario Draghi and the Council President Donald Tusk. In fact, more people know these top EU officials than the current Spanish or Italian Prime Minister or Polish President. This seems to confirm our previous findings that by July 2015 knowledge about the EU and its officials is in fact quite high.
Do we again find that knowledge about the EU is higher in the Eurozone compared to the non-Eurozone? Figures 6.1 and 6.2 present the same information about name recognition of national and European leaders as presented above, but they separate the results for countries within and outside the Eurozone. For name recognition of national leaders Obama and Merkel, we find little difference between the Eurozone and non-Eurozone member states. But for EU officials we find more
variation. Except for Council President Tusk, people in the Eurozone are more likely to recognize the names of top EU officials compared to those outside. Interestingly, this holds especially true for Draghi and Dijsselbloem. While in the Eurozone 44 and 20 percent of people recognize their names, these shares are much lower in the non-Eurozone, namely 13 and 6 percent respectively.

When we compare the name recognition of top EU officials across regions, striking differences emerge that suggest that the Eurozone crisis starkly increased knowledge about EU affairs. Name recognition is by far the lowest in the North non-Eurozone member states followed by the East. Do note that most people in the East have heard of Council President Donald Tusk. Given that he was the President of Poland, this might not be entirely surprising. Interesting is also the fact that name recognition of Mario Draghi is enormous in the South: 69 percent have heard of the ECB President. In fact, as many southerners have heard of Draghi as have of French President Hollande. In the North non-Eurozone and East name recognition of Draghi is lowest.

Finally, Figure 7 shows the share of people that have heard of top EU officials in Great Britain (the figures for the five other largest member states can be found in the Appendix). British citizens not only hold the lowest level of factual knowledge about the EU, they are also least aware of who its top
officials are. Less than a third of British citizens have heard of the leaders of Europe’s legislative and executive institutions, Commission President Juncker, European Parliament President Schulz and Council President Tusk. Even fewer British citizens have heard of ECB President Draghi or the chair of the Eurogroup Dijsselbloem, 9 and 4 percent respectively. Given that Great Britain is not part of the Eurozone, less knowledge about the latter two might not be surprising, yet the low levels of name recognition of other EU leaders underline our previous result that knowledge about EU affairs is very low among British citizens.

Membership and Euro Support

After we have established that on average people are quite knowledgeable about the EU, we delve deeper into their EU preferences. When examining support for political systems, political scientists often make a distinction between two different modes of political support: diffuse and specific (Easton 1965). Whereas diffuse support refers to the evaluation of the regime, broadly defined as the system of government and the constitutional arrangements underlying it, specific support relates more to policy, that is the binding collective decisions and actions taken by political actors operating in the broader system of government (see Norris 1999). Therefore in the context of European integration, scholars have distinguished between regime support and policy support (Hobolt and De Vries 2015). Regime support signifies support for the constitutional settlement of the EU, as laid down in the various treaties, including support for membership of this union. Policy support refers to support for the content of collective decisions and actions taken by EU actors.

Regime support is crucial to any system since it allows systems to retain legitimacy even when people become disillusioned with the performance of specific governments and policies (see Norris 1999). In established democracies, regime support is often taken for granted; yet in the context of the EU it is still
fragile. Unlike most established nation states, the EU is characterized by a hybrid multi-level political system (Hooghe and Marks 2001). Moreover, there exists uncertainty about the scope of its competences, its demos, and its external boundaries. Moreover, the aims of the Union are contested by politicians and publics in many member states. This presents a considerable challenge to the European project (Mair 2007, De Wilde and Trenz 2012). Yet, at the same time, the far-reaching economic and political integration in Europe means that the EU is increasingly dependent on public support as it lacks long-lasting loyalty to its goals and institutions like that found at the national level. Since the actions of all elites will occasionally fail to meet public expectations, i.e. policy support in the EU will be variable, the Union needs a buffer against short-term policy failures through some degree of regime support (Scharpf 1999). Consequently, an examination of regime support in the EU is of vital importance.

Figure 8 below provides an overview of the proportion of people that support their country's membership in the Union. Specifically, we asked respondents the following question: “Imagine there is a referendum and you could decide whether your country stays as a member of the European Union. How would you vote? 1) I would vote for my country to leave the European Union, 2) I would vote for my country to stay in the European Union.” The findings in Figure 8 suggest that on average broad-based support for EU membership exists throughout the 28 member states. Almost three-quarters of those surveyed (71 percent) would vote for their country to remain a member of the Union if a referendum about membership were held today.

Interestingly, support for membership does not vary much inside and outside the Eurozone. Figure 9 below shows that while support for membership in the Eurozone is at 72 percent, outside the Eurozone 69 percent of people would vote for their country to stay in the Union. Yet, we do find that support for membership is at its lowest level in the North non-Eurozone region (Denmark, Great Britain, Sweden). Although 62 percent of people in those countries would vote for their country to remain a member of the Union, 38 percent would vote against it, which is roughly 10 percent more than in the other regions.
If we inspect support for membership in the Union in the six largest member states, see Figure 11, we find that overall support for membership consists of well over two-thirds of the population in France, Germany, Poland and Spain, but is considerably lower in Great Britain and Italy. In these countries, the majority of the population would vote for their country to remain a member, but 41 and 38 percent respectively say that they would support an exit. The British findings are of course especially interesting given the prospect of a membership referendum in 2016 or 2017. Our findings confirm those of British polls conducted by YouGov and MORI that suggest that at the present time a small majority of Britons would favour membership over exit.

Overall, these findings suggest that regime support as measured through membership preferences remains high even given the recent turbulence caused by the Eurozone crisis. But what about support for the Euro? Is it more fragile? It is important to remember that support for the Euro can be perceived as a form of regime support only in the Eurozone as these countries have opted for the common currency as a sign of the European project. For non–Eurozone members support for the Euro might rather constitute a form of policy support and therefore could be more fickle. Figures 12.1 and 12.2 show the distribution of answers to the following question: “Ok, now imagine there is referendum on the Euro as a currency. Do you want your country to have the Euro as a currency? 1) Yes, I would vote for the Euro as a currency, 2) No, I would vote against the Euro as a currency” for the EU28 and Eurozone versus non-Eurozone members respectively.

While Figure 12.1 indicates that in the EU as a whole the share of people who would vote for the Euro in a referendum is about the same size as the one voting against the Euro, the findings presented in Figure 12.2 show that this figure, however, masks great variation between Eurozone and non–Eurozone members. While in the Eurozone countries a majority would vote to keep the Euro as their currency, in the non–Eurozone countries a clear majority of 74 percent would vote against introducing the Euro. If we delve even further into possible regional differences in Euro support (see Figure 13), we find that the opposition to the Euro is the greatest in Denmark, Great Britain, and Italy.
Great Britain and Sweden, i.e. the North Non–Eurozone, followed by the East. Moreover, it is interesting to note that the support for the Euro in the South that was adversely affected by the Eurozone crisis is equal to support among the creditor countries in the North Eurozone.

Finally, Figure 14 presents the average support for the Euro in the six largest member states in terms of population size. As expected, support for the Euro is lowest in Great Britain, only 14 percent of British citizens would vote for the Euro in a referendum; quite unexpectedly perhaps, it is the highest in Spain, a country that was hit hard in the Eurozone crisis and has experienced austerity measures since then. Yet, both support for membership and the Euro remain extremely high in Spain. Support for the Euro reaches the 60 percent mark in both France and Germany, yet compared to support for membership the Euro seems more contested in these countries. In Italy we find that there is only a slight majority that supports the Euro, namely 56 percent. This mirrors the slightly weaker support for membership compared to France, Germany, Poland and Spain found in Figure 11.

On the whole, these findings suggest that regime support as measured through membership preferences and Euro preferences in the Eurozone is considerable. Italy shows the lowest support although a majority of Italians support their country’s membership in the Union and the Euro. In the non–Eurozone support for membership, with the slight exception of Great Britain, is high while support for the introduction of the Euro is low. Given the problems surrounding the Eurozone crisis and the Greek bailouts, this may not come as a surprise. Overall, regime support in the Union is substantial. This is important for the EU in order for it to weather past and current policy challenges, such as those concerning the Euro and the large influx of refugees from Africa and the Middle East.
Support for Further Political and Economic Integration in Europe

Average support for further political and economic integration in Europe is also high among the European citizenry. In our survey we solicited integration preferences using the following question:

“If you had to choose, which of the following statements best describes your overall attitude towards European integration?

1. We need more political and economic integration across Europe
2. Things should remain as they are today
3. We need less political and economic integration across Europe.”

Figure 15 below shows the distribution of responses for our representative sample of all 28 EU member states.

The findings show that 59 percent of people prefer more political and economic integration in Europe, while only 24 percent prefer less and 16 percent wish the status quo to remain as it is. This suggests that not only do a majority of people prefer their country to remain in the EU, they also wish to see further integration in the future. Yet, this picture might change when we consider regional and country differences as displayed in Figures 16 through 18. Indeed, it does. Figure 16 shows that support for more political and economic integration is, with 64 percent,
14 percent higher in Eurozone countries compared to non-Eurozone countries.

The findings presented in Figure 17 suggest that while support for further integration is far more pronounced in the Southern region, namely 71 percent of people favour more political and economic integration, it is the lowest in the North non-Eurozone region, where only 41 percent do. Support for further integration in the East and North Eurozone is almost identical with a slight majority, 58 and 53 percent respectively, favouring more integration.

Finally, Figure 18 indicates that only in Great Britain do we find an equal share of people favouring more versus less integration (both 39 percent). More than three-quarters of Italians and Spaniards favour more integration. In Germany, France and Poland also a slight majority of people do: 56 percent. Put together, these findings indicate that on average people in the Union favour more political and economic integration in the future, but that this support is slightly higher in countries that are part of the Eurozone and especially in southern member states. The fact that southern member states are on average more supportive of integration is interesting as they have experienced adverse effects of the Eurozone crisis and had to implement controversial austerity packages as a result. Like in the case of membership and the Euro, support for further integration is at its lowest level in Great Britain where only slightly more than a one-third of people favour more integration.
The Biggest Policy Achievements and Policy Needs in Europe

So far, we have reviewed people’s regime preferences and paid little attention to support for policies. Even though we found that people are quite knowledgeable about the EU, we cannot realistically expect them to have clear opinions about detailed policy proposals or outcomes. Rather we ask respondents about their views on the EU’s biggest policy achievements to date and the policy areas that need more attention. In order to facilitate responses, we provided them with a list of options:

**Biggest policy achievements:**

1. Opening borders across Europe
2. Establishing a common currency
3. Creating a common agriculture policy
4. Facilitating trade across Europe
5. Securing peace and cooperation
6. Supporting reform in Eastern Europe
7. Fighting climate change
8. Protecting consumers’ rights
9. Creating jobs
10. Protecting human and social rights

**Policy Areas Needing More Attention:**

1. Harmonizing taxes across Europe
2. Securing borders
3. Reforming immigration policies
4. Helping poor countries
5. Strengthening consumer protection laws
6. Fighting climate change
7. Supporting economic growth
8. Investing in infrastructure
9. Reducing inequality
10. Secure peace and security
Figures 19.1 and 19.2 present an overview of responses to both sets of questions. Within the EU28 people feel that both the opening of borders and the facilitation of intra-EU trade are Europe’s biggest achievements (46 and 45 percent each), followed by securing peace and cooperation (40 percent) and establishing the common currency, creating jobs and protecting human and social rights (37 percent). By far the most important policy priorities in the eyes of EU citizens are securing peace and security (61 percent) and supporting economic growth (54) in Europe.
Next to these policy priorities, people also view the reduction of social inequality (47 percent) and the reform of immigration policies (42 percent) of key importance. Figures 20.1 and 20.2 show the distribution of perceptions of the EU’s biggest achievements and most pressing policy priorities for the Eurozone member and non-Eurozone member respectively. In terms of policy priorities we find little differences between people who reside in the Eurozone versus those that reside outside. Differences regarding the perceptions about the EU’s biggest achievement differences are also small, but we do find that while the opening of borders is perceived as Europe’s biggest achievement in the non-Eurozone, more intra-EU trade is within the Eurozone countries.

Finally, when we inspect regional differences in Figures 21.1 through 21.2, we also find less disagreement about people’s views about which the most pressing policy priorities should be compared to people’s perception of the EU’s biggest achievements. Across the North, South and East, people...
view peace and security as well as economic growth as the Union’s top priorities. When it comes to Europe’s biggest achievements in the North Eurozone, the opening of borders and the facilitation of intra-EU trade as well as creating jobs was high on people’s lists, while in the North non-Eurozone human rights was considered a key achievement of the EU, much more so than opening borders. People in the South mentioned creating jobs, and peace and human rights, while in the East we find a pattern similar to the North Eurozone: people mention opening borders and trade first when thinking about the EU’s biggest achievements.

Overall, peace and security feature as the most important policy priorities in the EU, while the facilitation of trade and the opening of borders were mentioned frequently as Europe’s biggest achievements. Yet, considerable regional variation exists (results for the six largest countries can be found in the appendix).
Views about the Direction the EU and the Country are Moving

So far, we have established EU citizens’ regime and policy preferences without any reference to the national level. Now we delve deeper into popular evaluations of policy by comparing their opinions about the policy direction in which they view the EU and their country moving. Recall that we suggested that research suggests that knowledge of specific outcomes is sketchy at best (Zaller 1992, Delli Carpini and Keeter 1996). By consequence then, political scientists often rely on general evaluations of the state of the country and/or the economy (see Kinder and Kiewit 1984, Anderson and Guillory 1997 for example). Following these insights, we tap into policy preferences by comparing and contracting questions about people’s evaluations about the policy direction in which their country or the EU is moving. Figure 22 below provides the comparison between the shares of people stating that the EU is moving in the right versus the wrong direction policy-wise, and those same shares when people are asked to evaluate the policy direction in their country. The results indicate that in the EU28 people view policies in the EU moving in the wrong direction (72 percent), but that they are equally sceptical about policies in their own countries (68 percent).

Interestingly, if we split these results for Eurozone versus non-Eurozone countries (Figure 23), we find that within the Eurozone people are on average more sceptical about the EU or their country’s policy direction compared to those outside the Eurozone. People within the Eurozone are 14 and 11 percent more sceptical about the policy direction of the EU and their country respectively compared to those outside.
In terms of regional differences as presented in Figure 24, we find that people in the South are most sceptical about the direction in which things are moving in the EU and in their respective countries, while people in the East are the least sceptical about the policy direction in the EU and less so than about the policy direction of their country. With the exception of the East, people are slightly more sceptical about the policy direction of the EU compared to their own country, although in the South these differences are almost negligible.

If we delve a bit further into the variation across countries by focusing on differences within the six largest member states (Figure 25), we find that Italians are most sceptical about both the policy direction in the EU and their country, while Poles are least sceptical. In most countries, except for Germany and Great Britain, people are equally sceptical about policy direction in the EU compared to their own country. Only in Germany and Great Britain do we find that the difference between both evaluations is statistically significant (p<.05). Germans are on average 9 percent and British 12 percent more sceptical about the policy direction in which the EU is moving compared to their country, albeit that the majority of them is on average more sceptical than optimistic about the policy direction in their country.
These findings suggest that while we previously found that regime support is quite high in the EU, policy support is not. The majority of people in the 28 member states are weary of the EU’s policy direction. Yet, at the same time, they are also sceptical about the policy direction of their own country. People in the South, and especially Italians, are deeply sceptical about the direction things are moving in their country and the EU, while Germans and British display more scepticism towards the EU than the policies in their own country, albeit that still a majority of them feel that things are moving in the wrong direction in their own country.

How to Talk to Friends about the Union

The scepticism about the way things are progressing in the EU is also reflected in responses to the question: “Imagine you talk with a friend or colleague about the European Union. Would your conversation be 1) very positive, 2) positive, 3) negative, or 4) very negative.” Figures 28 through 31 displays the number of people either responding positively (1 or 2) or negatively (3 or 4) in the EU28, the Eurozone versus non-Eurozone, across regions and in the six largest member states respectively.

These figures indicate that on average people in the EU28 would be equally likely to talk positively about the EU to friends than they would be to talk negatively (Figure 26). We find very little difference between Eurozone versus non-Eurozone countries, albeit that people outside the Eurozone would be slightly more positive 56 versus 51 percent (Figure 27).
Yet, when we inspect the differences between regions, it becomes clear that the slightly higher positive tone to friends in non-Eurozone countries is primarily driven by responses from the East (Figure 28). People within the North non-Eurozone would on average be more negative about the EU than positive (53 versus 47 percent). We find a similar pattern in the South where people would more likely talk negatively than positively about the EU to friends although the difference here is quite small. Finally, if we inspect differences across the six largest member states we find that the British, French and Italians are the least positive about the EU to friends, while the Poles are the most positive (Figure 29).

In all, these findings suggest that in our survey people are on average equally likely to talk positively as negatively about the EU to friends. Yet, in the East, especially in Poland, they would by far be the most positive, while British, French and Italians would speak the least positively about the EU to friends.
German Leadership in the Union

A final attitude that we will consider before turning to our conjoint experiment is a respondent’s view about Germany’s role in the Union. Specifically, we asked respondents to consider the following: “Germany is often seen as taking a leadership role in the European Union. Do you think this is 1) very good, 2) good, 3) bad?”. The figures below present the share of people either responding that they approve of Germany’s leadership in the Union (1 and 2) or they do not (3). Figure 30 below provides this information for the EU as a whole. We find that a majority of people approve of Germany’s leadership in the Union, albeit the difference with disapproval, 55 versus 45 percent respectively, is rather small.

Interestingly, Figure 31 demonstrates that approval of German leadership is with 59 versus 53 percent higher in the non-Eurozone compared to the Eurozone countries.

Comparing approval across the different regions (Figure 32) suggests that it is the lowest in the southern member states and highest in the North Eurozone. Considering that
Germany is the biggest creditor country and thus largely defends the creditor positions of the North Eurozone in the Euro Group against the positions of debtor countries in the South, these differences should not come as a surprise. Interestingly, when we look further into this by exploring differences across generations in the South (see Table 3), we find that approval in the South is actually highest amongst the youngest age cohort between 15 and 25, which is unexpected.

**Table 3: Oldest and Youngest Generation in the South Most Positive about German Leadership in the Union**

<table>
<thead>
<tr>
<th>COHORT</th>
<th>% GERMAN LEADERSHIP IS GOOD</th>

<tr>
<td>35-26 year olds</td>
<td>40.16</td>
</tr>
<tr>
<td>25-15 year olds</td>
<td>51.17</td>
</tr>
</tbody>
</table>

Finally, Figure 33 explores differences in approval of German leadership in the six largest member states, and we find that Italians and Spaniards are most sceptical with 71 and 61 percent respectively, followed by the British with 52 percent. Approval of German leadership, however, is high in France and Poland as well as in Germany of course. These findings suggest that German leadership is quite contested in the South, which might be the result of the Eurozone crisis and austerity requirements proposed in Brussels largely under German leadership. Yet, the finding that approval among the youngest age cohort between 15 and 25 is with roughly 60 percent the highest among all cohorts in the South suggests that these attitudes might change in the future.
Part II

What Kind of Europe Do Europeans Want?

...
what kinds of European integration and which type of reform Europeans actually want. The multi-dimensional and complex nature of public support for European integration should thus receive much more scholarly and popular attention. In the following pages we provide the first in-depth examination of public support for different EU reform proposals across member states. Building on and extending existing work on public support for European integration that we outlined before, we have examined the trade-offs people make between different aspects of integration. Specifically, we focused on four dimensions of European integration:

1. **The functional dimension:**
   What type of European integration do EU citizens want?

2. **The communal dimension:**
   With whom do EU citizens want this integration?

3. **The utilitarian dimension:**
   How much are EU citizens willing to pay for this integration?

4. **The institutional dimension:**
   How do EU citizens want this integration be governed?

These different dimensions capture the most important trade-offs that citizens face and are thus at the core of our data collection.

**A Note on Understanding the Conjoint Results**

In the conjoint experiments used here, we ask respondents to rank and rate five sets of two hypothetical choices, in this case reform proposals for the EU. These hypothetical choices have multiple attributes, that is to say they vary on four different dimensions of European integration outlined above. The goal here is to estimate the influence of each attribute of these dimensions (based on a linear probability or ordinary regression model) on the choices and ratings of the respondents for a given reform proposal. In order to make sure that alternative explanations are taken care of we use conjoint method based on a fully randomized design. So what does this mean exactly? Each respondent sees five sets of two different reform proposals that differ on the attributes of the functional, communal, utilitarian and institutional dimensions and after each individual comparison are then asked two questions: first, which proposal (A or B) do you prefer, and second how would you rank each of the proposal. The ranking question was formulated as follows: "Please also evaluate each option individually. How likely is it that you would support ‘Option A’/‘Option B’ in a referendum? 1) very likely, 2) likely, 3) not likely, or 4) not very likely". Table 4 below provides an example of one set of reform proposals that respondents were asked to choose between and rank.
Table 4: Example of a Choice in the Conjoint Experiment

<table>
<thead>
<tr>
<th>DIMENSION</th>
<th>OPTION A</th>
<th>OPTION B</th>
</tr>

<td>What should the primary policy goal of the EU be?</td>
<td>Secure Peace and Security</td>
<td>Fight Climate Change</td>
</tr>
<tr>
<td>Which option do you prefer?</td>
<td>O</td>
<td>O</td>
</tr>
</tbody>
</table>

The order in which the attributes of the different dimensions were presented was fully randomized. This allows us to assess the influence of different features of the reform proposals, costs or number of member states for example, on how respondents evaluate a given proposal relative to another. One of the advantages of randomizing the exact values on the different dimensions that feature on a reform proposal is that one does not need to rely on any assumptions about the functional form that maps reform proposal features on support (see Hainmueller, et al., 2014). Also, the randomization ensures that the treatment groups are comparable with respect to alternative explanations, such as the way in which they interpret some of the information provided differently. The attributes of the different dimensions of the reform proposal are listed in Table 5 below.

Interpreting conjoint results is less straightforward than the survey results presented in Part I, but really not difficult. As one can see in Figure 35, which presents the conjoint results for the EU28, the y-axis lists all the different features of each of the four dimensions: the utilitarian, institutional, communal and functional dimension. On the x-axis, the size of the effect of each attribute, for example 15 member states or a €35 annual contribution, on the choice for one of the two reform proposals is presented.\(^4\) If the effect of an attribute is large and positive then this attribute makes people prefer an EU reform proposal more, whereas if the size of the effect is large and negative it indicates that this attribute of the proposal makes people prefer an EU reform proposal less. Note that the sizes of the effects are always presented in reference to the current EU, i.e. the status quo. That is to say, we present the effect of the different annual costs in reference to the average annual cost per capita (for the EU28 this is €0); the effect of different decision-making bodies in reference to the European Parliament making decisions; the effect of a different number of member states in reference to the current number of 28; and finally, the effect of different policy goals in reference to the promotion of economic growth. The thing that is important to take away from the graph is that if the size of the effect for a particular attribute, designated by the dot (the line around it provides the 95% confidence interval around the estimated coefficient), takes on a value greater than 0, people wish to see a change in the EU away from the status quo. When the size of the effect is smaller than 0, people prefer the status quo over the proposed reform. If dots for an attribute are on the red line in the figures this shows that people are indifferent about this reform and the status quo, while dots to the right of the red line indicate a preference for change away from the status quo, and dots to the left of the red line indicate a preference for the status quo rather than the proposed reform.

\(^4\) This number equates to the size of a coefficient from a linear probability model with the support for the EU reform proposal as the outcome variable.
Support for EU Reform Proposals

Let us inspect the support for EU reform in the EU as a whole (Figure 34). The results show that people desire two changes to the current status quo: namely that decisions are taken by referenda rather than by the European Parliament, and that the EU focus is primarily on peace and security issues rather than economic growth. People are indifferent about raising the average contribution to €35 in the EU compared to the current level of €0, and about national governments or the European Parliament making decisions. In terms of reforms that people oppose, we find that in terms of costs people do not want to contribute much more to the EU annual budget than €35 per capita per year. When it comes to decision-making, people are strongly opposed to the notion of an elected European President or the Commission taking decisions. They prefer the European Parliament doing so. In terms of membership, they strongly oppose a smaller Union, but interestingly are slightly less opposed to an EU with more member states, albeit that they display a slight preference for the EU of its current size. Finally, people prefer an EU promoting economic growth over other policy goals such as securing energy safety, combating climate change or regulating immigration.

**FIGURE 34** Support for EU reform in 28 member states

- Costs
- Decisions
- Members
- Goals
Overall, Figure 34 provides us with a first peak into Europeans’ EU reform preferences and shows that making decisions by referenda and making the EU focus more on peace and security are important reform considerations for the average citizen. Yet, these results for the EU as a whole may mask important cross-national variation. Figures 35.1 through D below present the same results, but split by region. The interpretation of these graphs is identical for that of Figure 34 except for the fact that the reference-point for the status quo when it comes to costs, i.e. the annual per capita contribution to the EU budget, varies by region. For the North Eurozone (Figure 37.1), the status quo is €67, for the North Non-Eurozone €107, for the South €35, and finally for the East the average contribution per capita is €0.

Figure 35.1 shows that citizens residing in the North Eurozone favour a Union that is slightly cheaper in terms of annual contribution per capita, albeit the effects for €0 and €35 compared to the current level of €67 are rather small. They clearly oppose an increase to a level of €107 or €211. In terms of decision-making, they are indifferent about decisions being made by national governments or the Commission compared to the European Parliament, while they favour citizen referenda. As in the EU as a whole, citizens in the North Eurozone are far from enthusiastic about the notion of an elected European President making decisions. In fact, they clearly oppose it. In terms of membership, they clearly oppose a small EU of only six member states, while they are only slightly negatively predisposed to an EU that comprises 15, 35 or 40 member states compared to the current 28. In terms of the policy goals that the EU should pursue, they strongly favour peace and security over economic growth even more so than was the case for the EU28, but an EU that focuses on social inequality, immigration or climate change is equally preferable to one that promotes economic growth. Citizens in the North Eurozone do prefer an EU that focuses on economic growth over one whose primary concern is energy safety.
Turning to citizens in the North non-Eurozone, the British, Danes and Swedes display similar reform preferences compared to their counterparts in the North Eurozone, expect for their decision-making and policy preferences. Contrary to citizens in the North Eurozone, British, Danes and Swedes are much more in favour of decisions taken either through citizen referenda or by national governments. They seem wearier of EU institutions making decisions, especially were it to be an elected European President. In terms of policy goals that the EU should pursue, peace and security is highest on their agenda followed by economic growth and immigration (on the latter two the British, Danes and Swedes are indifferent.) Contrary to the North Eurozone citizens, however, they would be less in favour of an EU focusing on social inequality and climate change.
In the South, we find that citizens’ strongest preference for a change relates to citizen referenda; these are much preferred over decision-making by the European Parliament. Like citizens in the North, they prefer an EU that is cheaper, and oppose a smaller versus a larger EU in terms of member states. When it comes to policy preferences, they differ from the North in that they are indifferent about an EU that focuses on economic growth or one that prioritizes peace and security. Given that the South was hit hard by the Eurozone crisis, a strong preference for an EU that promotes growth should not come as a surprise.

The final region we consider is the East and these results feature in Figure 35.4. People in the East display even more differences to the North than we found for the South. Interestingly, they are willing to do more for the EU than they currently do, paying even up to €107 a year. This pattern deviates from all other regions where citizens are not willing to pay more. Citizens in the East, like those in the North Non–Eurozone, are weary of EU institutions taking decisions, especially a directly elected President. They favour citizen referenda but are indifferent about national government vis-à-vis the European Parliament. They strongly oppose the idea of a smaller EU, and are indifferent about an EU with 28 versus a Union with 35 or 40 member states. Finally, like the South, Central- and East- European citizens are most supportive of an EU that deals with economic growth or peace and security, these policy goals are much more preferred to policies like combating climate change or regulating immigration.

How are EU reform preferences distributed across the six big member states? Figures 36.1 through F show the results of the conjoint experiment in Germany, France, Great Britain, Italy, Spain and Poland, respectively. In Germany, we find that people prefer an EU that is cheaper, and are equally favourable about the prospect of an EU that would have 15, 35 or 40 member states compared to 28. Germans most strongly differ from the EU as a whole in terms of their decision-making or policy preferences. They support decision-making through referenda compared to the European Parliament, but are equally happy with an EU in which decisions are made by national governments or the Commission. Interestingly, they also seem much less opposed to the idea of a directly elected EU
President compared to citizens in the EU as a whole. In terms of policy, German citizens strongly favour peace and security as the EU’s main policy goal. Peace and security is preferred over economic growth, but expect for a slight opposition to energy safety, Germans are indifferent between other goals, such as immigration, climate change or social inequality.

French opinion resembles the Germans’ opinion in many respects. But more than the Germans, the French are indifferent about the European Parliament making decisions or a directly elected EU President (Figure 36.2). This might reflect their national experience with an elected President. Like the Germans, however, the French do favour decisions being made via citizen referenda, but are indifferent about national governments or an EU institution taking decisions. The French favour the current number of member states over a smaller EU or larger one. In terms
of policies, they differ slightly from the Germans in that they favour an EU that addresses social inequality, immigration and economic growth to an equal extent. The British hold different opinions about EU reform compared to the Germans and French (Figure 36.3). They differ mostly in terms of decision-making preferences as they clearly favour decisions being made by national governments or via EU referenda rather than by the European Parliament. These effects are quite substantial. This British preference for decision-making by national governments is clearly different than the overall EU pattern. In terms of preferred policy goals, they are, like the Germans, in favour of peace and security, followed by immigration and economic growth.

Figure 36.4 shows the results for the Italian representative sample. The Italians like the British, Germans and French favour a cheaper EU compared to their current contribution of €107, and want an EU that comprises more than six member states. They, like the citizens in the EU as a whole, favour citizen referenda, and oppose a directly elected EU President. Contrary to the British, Germans and French, however, Italian citizens are strongly in favour of an EU that promotes economic growth, slightly more so than peace and security and immigration.

The results for Spain, which are displayed in Figure 36.5, show that like the Italians, Spanish citizens strongly favour citizen referenda over EU decisions being made by the European Parliament. They also favour a bigger EU with at least six member states. Like the Italians, they support an EU reform proposal more when it is focused on promoting economic growth, yet contrary to the Italians they favour growth equally to social inequality and peace and security. Interestingly, in terms of annual costs, Spaniards seem to be willing to pay a bit more for the EU as they currently do. They are equally supportive of a reform proposal that would mean paying €35 compared to their current €0 (they are a net recipient).
Finally, the Poles are strongly opposed to a smaller EU, and clearly favour an EU that deals with peace and security over economic growth followed by social inequality. Similar to the Italians, they are indifferent about national governments, the Commission or the European Parliament making decisions, while clearly favouring decision-making via citizen referenda. Like the Spaniards, the Poles are currently net recipients, and even willing to pay more than the Spaniards for the EU, namely a contribution of up to €67 per capita annually.

Overall, our inspection of the support for EU reform across the EU as a whole, within regions, and in the six largest member states has revealed that people
prefer a larger over a smaller Union. They prefer an EU in which citizens make decisions through referenda rather than the European Parliament, their national governments or other EU institutions, and they strongly oppose a directly elected EU President. On average, they feel that the primary policy goal of the Union should be to safeguard peace and security over economic growth. Yet, important cross-national differences exist. For example, the Spaniard and Poles currently net recipients of the EU budget, are willing to pay slightly more for the EU in the future. The French are equally enthusiastic about the prospect of decisions being taken by directly elected President compared to the European Parliament, while the Brits prefer national governments being in control, at least equally to decision-making via referenda. Finally, we find differences based on people’s policy preferences, while people in the South and East care most about economic growth, citizens of the North favour a Union dealing with peace and security and view immigration of equal importance to growth. Now we will turn to individual level differences based on socio-demographics, like age gender, as well as people’s levels of EU regime or policy support.
Differences in Support for Reform Proposals Across Generations

Figures 37.1 and 37.2 below show EU reform preferences across generations. We have plotted divergent preferences about how decisions should be made in the EU and which policy goal should be pursued only, as generations largely degree on costs and the number of member states. They prefer a cheaper Union and are opposed to a smaller number of member states (see figures in the Appendix). Figure 39.1 shows that while all generations prefer EU reform proposals in which decisions are being made via referenda over those in which the European Parliament makes decisions, only the youngest generation of 15 to 25 year-olds opposes decision-making by national governments over decisions being taken by the EP. This lack of enthusiasm about national government involvement in the EU among the young provides an interesting prospect for integration in the future. This generation seems less in favour of intergovernmental decision-making than their slightly older peers.
When it comes to policy preferences we also find interesting differences across generations (Figure 37.2). While older generations support an EU that promotes economic growth equally to one that safeguards peace and security, the 15 to 25 year-olds display a slight preference for an EU that deals with peace and security. This effect is of similar size in fact to the one for the over 55 year-olds, although the latter effect fails to reach conventional levels of statistical significance indicating that for the oldest generation peace and security is also very important, but equal to economic growth. The finding that the youngest generation favours reform proposals in which the primary policy goal of the EU is establishing peace and security is particularly interesting given that many argue that this reason for unification in Europe is something younger people relate to less given that they lack war experiences. Our results indicate that this commonly held opinion lacks a clear empirical foundation.

Another interesting difference across generations exists when it comes to immigration as an EU policy goal. While citizens younger than 55 prefer EU proposals that promote economic growth over those that regulate immigration, the oldest generation is indifferent between the two.

We delve deeper into divergent preferences between generations when it comes to the policy goals that the EU should pursue by exploring these within the different regions (Figures 38.1-4). Several interesting findings stand out. In the North Eurozone for example, we find that the youngest generation prefers an EU that maintains peace and security or that fights climate change over one that promotes economic growth, while older generations would like to see peace and security as the primary policy goal of the EU followed by economic growth. We already found that dealing with climate change in a EU context is mainly viewed as important in the North Eurozone (see Figure 38.1), these findings suggest that this especially true for the 15 to 25 years-olds.
Citizens residing in the North Non-Eurozone prefer immigration equally to economic growth (Figure 35B), but Figure 38.2 indicates that this is primarily driven by the preferences of the over 55-year-old generation. Younger generations favour an EU that promotes economic growth over one that regulates immigration.

In the South, we find that the regulation of immigration is viewed as equally important to the promotion of economic growth in the EU context by all generations except for the youngest one. Interestingly, both the oldest and youngest generation prefer an EU that maintains peace and security over one that promotes growth. Younger generations are indifferent about an EU fighting climate change to one that secures growth contrary compared to older ones that clearly favour growth (Figure 38.3).
Finally, Figure 38.4 shows that generations in the East differ only in respect to their preferences for peace and security and immigration. While the oldest generation favours an EU that regulates immigration equally to one that secures growth, the youngest generation in Eastern Europe has a clear preference about what the main policy goal of the EU should be, namely peace and security.

Next to regional variation (for full results see figures in the Appendix), our evidence also provides interesting variation across generations within the six largest member states. Within these six countries, generations differ mainly in terms of their decision-making preferences (for full results see figures in the Appendix). Figure 39.1 shows that while the older generations in Great Britain favour national governments making decisions in the EU over the European Parliament, younger Brits between 15 and 25 years-old are indifferent between the two.
Interestingly, the British results also indicate that the preference for citizen referenda as documented in Figure 36.3 is not shared by the oldest and youngest generation, they are both indifferent about decisions being taken by referenda or the European Parliament.

In Germany, however, we find that citizen referenda as a means to take decisions in the EU is only really supported by citizens over 55 years old, the younger generations favour referenda equally to decisions made by the European Parliament (Figure 39.2). In general generations in Germany largely agree on other ways in which decisions ought to be taken in the EU. Interestingly, and contrary to the German case, in France we find that the younger generations, specifically those below 35, favour citizen referenda over European decisions taken by the European Parliament (Figure 39.3).
Similar to the French case, and thus contrary to the German findings, we find that younger Spaniards and Italians compared to older generations are much more in favour of decision-making in the EU taking place via citizen referenda rather than through the European Parliament (see Figures 39.4–E).

In Poland we find that while older generations opposed to the notion of a directly elected EU President taking decisions, the youngest generation is indifferent between a President or the European Parliament taking decisions (Figure 39.6). In addition, younger Poles are largely indifferent about decision-making via the European Parliament or national governments, while the above 55-year-olds are opposed to the idea of national governments rather than the European Parliament making decisions.
So, when it comes to differences based on age, we find that generations primarily disagree about decision-making and policy goals in the EU. For example in France, Italy and Spain younger generations favour citizens as the main decision makers via referenda, while in Germany only older generations do. When it comes to policy preferences, we find that both the oldest and youngest generations favour an EU that safeguards peace and security over one that promotes growth. This demonstrates that citizen support for the original idea behind European unification is not just popular among older generations who were socialized in times of World War II or the Cold War.
Differences in Support for Reform Proposals Across Men and Women

In the previous section, we uncovered interesting differences between generations, how about differences between men and women? Figure 40 below provides an overview of the different views about EU reform between men and women in the EU as a whole. Interestingly, we find very few differences between the sexes. The only statistically significant difference exists when it comes to policy preferences: women are more in favour of an EU that deals with peace and security in respect to economic growth than men. On the whole, however, we find no real differences between men and women in the EU as a whole, across regions or within the six largest member states (for full results see figures in the Appendix).
Differences in Support for Reform Proposals Across Eurosceptics and Euro-supporters

Now we turn to differences in EU reform preferences based on level of regime and policy support. In Part I of this report, we provided an overview of EU preferences and demonstrated that on the whole our survey respondents were in fact quite knowledgeable about the EU. In Figure 41 we now explore if people’s factual knowledge—i.e. did they know that Switzerland is not an EU member or that not all countries have the same number of European parliamentarians—also mediates their preferences for EU reform. The results indicate that people with high and low knowledge about the EU in fact differ very little in terms of EU reform preferences. People with less knowledge are slightly more in favour of an EU that is cheaper, albeit these differences are by no means large, and people with higher knowledge demonstrate a clearer preference for an EU of 28 member states or one that is perhaps even larger. Figures in the Appendix present the reform preferences split by EU knowledge across regions and the six largest member states, and indeed show that very little difference exists.

These findings indicate that reform preferences do not differ substantially across citizens with high and low knowledge about the EU. This is in some ways good news for our conjoint experiment. Both respondents with high and low levels of EU knowledge provided coherent preferences that intuitively make sense, that is to say that they all prefer a cheaper EU of more or less the current size that is predominantly designed to safeguard peace and security as well as promote economic growth, and about which they themselves can decide in referenda. Yet, based on the findings we presented in Part I we also know that people differ substantially when it comes to regime and policy support. Although a majority supports membership and further integration, people are much more divided about the Euro and the overall policy direction of the Union. Against this backdrop it seems pertinent to explore if these diverging levels of regime and policy support in fact mediate EU reform preferences.

Figures 42.1 and B display people’s EU reform preferences by their support for EU and Euro membership. Interestingly, the results are very similar across these two types of support. Membership-sceptics and Eurosceptics favour an EU that is cheaper; they are less opposed to a lower number of member states; they favour an EU that deals with peace and security like their counterparts who support membership and the Euro, but differ in that they are indifferent between an EU that would regulate immigration versus one that promotes economic growth. Membership-supporters and Euro-supporters clearly favour growth. Immigration thus seems a key concern for membership-sceptics and Eurosceptics. That said, the largest difference between supporters and sceptics stems from their views about who ought to take decisions in the Union. Membership-sceptics and Eurosceptics are more opposed to EU institutions taking decisions and strongly favour decisions being made by referenda or national governments rather than by the European Parliament. This latter finding is especially interesting as it suggests that in terms of EU reform preferences, sceptics — either based on membership, the Euro, or both — clearly favour a Union that guarantees more national-based versus European-based control, either by means of citizen referenda in which national publics decide or through citizen representation via national governments.
It is interesting to see that these differences between sceptics and supporters when it comes to membership are stable across regions (Figures 43.1–4).

Membership-sceptics in all regions clearly favour national governments or citizens deciding per referendum over the European Parliament. In the North, sceptics also strongly prefer immigration to be the EU’s primary policy goal over economic growth, while in the South and East membership-sceptics are indifferent between immigration and growth. We find very similar patterns across the six largest member states (see figures in the Appendix) and across regions and the big six when it comes to sceptics and supporters of the Euro (see figures in the Appendix).
Figure 44 shows the differences in EU reform preferences based on people’s support for further political and economic integration in Europe. Here we divide respondents into three groups based on their responses to the question: “If you had to choose, which of the following statements best describes your overall attitude towards European integration? 1) We need more political and economic integration across Europe (more integration), 2) Things should remain as they are today (status quo), 3) We need less political and economic integration across Europe (less integration)”.

The findings indicate that people who favour less political and economic integration in Europe have very similar reform attitudes compared to membership-sceptics and Eurosceptics, namely they prefer national governments or citizens in referenda deciding policy in the EU rather than the European Parliament. Also, they favour an EU that regulates immigration equally to one that promotes economic growth. Finally, they prefer an EU that is cheaper compared to those citizens who want more integration or support the status quo.

People who want less political and economic integration thus differ most from those who want more or those who prefer the status quo based on their decision-making and policy preferences. We will explore these differences more in-depth by comparing regions in Figures 45.1–4 in the next pages.

Citizens in the North Eurozone who want less political and economic integration favour an EU in which decisions are made via referenda or through national government representatives, yet they are largely indifferent about any of the EU institutions, Commission, President or European Parliament, making decisions. People who favour more integration in the North Eurozone are largely indifferent about who should take decisions in the Union, with the exception that they clearly oppose the idea of a directly elected European President doing so.
All citizens regardless of their integration preferences wish to see an EU that focuses more on peace and security than economic growth, but they are more or less indifferent about growth versus climate change or social inequality. Citizens in the North Eurozone that favour the status quo or want less integration prefer an EU that regulates immigration equally to one that promotes growth.
People in the North non-Eurozone show similar preferences in terms of decision-making compared to those in the North Eurozone, but those that prefer less political and economic integration are clearly more in favour of an EU that regulates immigration over one that facilitates growth (Figure 45.2). People who want to see more integration in Europe and reside in the North Non-Eurozone clearly support the promotion of growth over the regulation of immigration as the EU’s primary policy goal, while those that favour the status quo are largely indifferent. While in the North Eurozone those that want less integration prefer the EU to focus on maintaining peace and security, those in the North non-Eurozone are indifferent between growth and peace and security.
Contrary to the North, all people in the South regardless of their EU preferences favour decision-making via referenda (Figure 45.3). Those that want less integration are slightly more in favour of national governments taking decisions over the European Parliament compared to those who want more integration, but this difference is slightly smaller compared to the North. In terms of policy preferences, sceptics of further integration are indifferent between social inequality, peace and security, immigration and growth. These could all be the core policy area the EU should deal with, but they strongly oppose an EU focused on energy safety and climate change over growth.

In terms of policy preferences, we find that the differences between those favouring more, less or the same integration in the East are rather small, except for those in favour of less integration being indifferent between immigration or growth being the EU’s primary policy goal (Figure 45.4). When it comes to decision-making preferences, sceptics of further integration in the East largely resemble those in the North, they prefer national governments or citizens via referenda taking decisions. Full results can be found in the Appendix, also for the six largest countries (see figures in the Appendix).
Finally, we turn to how people’s views about the overall policy direction in the EU and in their own country mediate their EU reform preferences (Figures 46 and 47 respectively). Interestingly, the results for those that oppose the overall policy direction in the EU are extremely similar compared to those opposing the overall policy direction in their country. These dissatisfied citizens want the EU to be cheaper, to stick to its current size of 28 member states, and to be ruled through national governments or via citizen referenda. The findings presented in Figures 46 and 47 resemble those for membership-, integration- and Eurosceptics reported earlier when it comes to decision-making preferences. Citizens who are sceptical about the policy direction in the EU (and in their country) wish decisions to be made by national governments and via EU referenda, and not by EU institutions. Those who approve of the overall policy direction in the EU or their national country, however, are indifferent between contributions of €0, €35 or €67, strongly oppose to national governments or a directly elected EU President taking decisions over the European Parliament. Yet, they are indifferent about the Commission, the European Parliament or citizens taking decisions.
via referenda, or an EU of 28, 35 or 40 member states. Citizens that are dissatisfied with the policy direction in the EU or their country differ least from those who are satisfied when it comes to policy preferences. These results are remarkably stable across regions and the six largest member states (see figures in the Appendix).

Overall, the largest difference between supporters and sceptics, be it in terms of membership, the Euro, integration or policies, stems from their views about who ought to take decisions in the Union. Compared to supporters, sceptics are much more opposed to a Union in which decisions are made by European actors rather than national ones. It seems that the type of EU reform that sceptics most want to see is that a move towards more intergovernmental decision making. An increase of national control is preferred either by means of citizen referenda in which national publics decide or through national governments.
What Stands Out About EU Citizens’ European Preferences?

1. Support for membership is high throughout the Union. It is the lowest in Great Britain, even though a majority of Britons would still vote for EU membership in a referendum.

2. A majority of people in the Eurozone support the Euro, and support for the Euro is the highest in the southern member states, even though these populations were hardest hit by the Eurozone crisis. That said, citizens in non-Eurozone countries strongly oppose the Euro, and support for the Euro is lowest in Great Britain.

3. On average, people favour more political and economic integration in the future. But this support is slightly higher in countries that are part of the Eurozone. It is especially high in the southern member states. The fact that southern member states are on average more supportive of integration is interesting as they have experienced the adverse impact of the Eurozone crisis and had to deal with controversial austerity policies as a result.

4. While support for the European regime (measured by support for membership and in the Eurozone support for the Euro) is high, European policy support is low. EU citizens are dissatisfied with policy direction in the EU, more so in the South, and especially in Italy. That said, people are equally dissatisfied with policy direction in their own country, less so though in Germany and Great Britain.

5. Europeans see the opening of borders and economic growth as the EU’s biggest achievements, while they view peace and security and the fostering of economic growth as Europe’s biggest policy needs.

6. When asked if they would talk positively or negatively about the EU to friends, EU citizens are on average equally likely to do either. Yet, people in non-Eurozone countries are more optimistic, a difference driven primarily by citizens in the East. The Danish, British and Swedish are more negative.

7. EU citizens are on average positive about German leadership in the Union, although in the South, Germany’s role in the Eurozone crisis is evaluated quite negatively. Interestingly, however, the results suggest that the youngest generation of 15- to 25-year-olds in the South holds the most positive views about German leadership.
What Stands Out About Preferences for EU Reform?

1. On average, people prefer an EU that is not too expensive, and of more or less the current size (28 member states). They want an EU that is predominantly designed to safeguard peace and security, as well as to promote economic growth, and about which they themselves can make decisions in referenda.

2. People in the EU as a whole strongly oppose the idea of a directly elected EU President taking decisions, even those that clearly favour more political and economic integration in the future. People are on average largely indifferent about national governments or the European Parliament being the key decision-makers.

3. Important cross-national differences in EU reform preferences exist. For example, the Spaniards and Poles, currently net recipients of the EU budget, are willing to pay more for the EU in the future, while Britons, French, Germans and Italians—all net contributors—are not. The French are equally enthusiastic about the prospect of decisions being taken by a directly elected President compared to the European Parliament, while the British clearly prefer national governments being in control or decisions being made through referenda. Finally, we find differences based on policy preferences: while people in the South and East care about economic growth, citizens of the North favour a Union dealing with peace and security. The view the regulation of immigration of equal importance to growth.

4. Although we find no differences based on gender, EU reform preferences do differ based on age. Generations primarily disagree about who should take decisions in the EU and what policy goals the EU should focus on. In France, Italy and Spain for example, younger generations favour decision-making via referenda rather than the European Parliament, while in Germany older generations do. When it comes to policy preferences, we find that both the oldest and youngest generations in the EU favour an EU that safeguards peace and security over one that promotes growth.

5. When it comes to how EU preferences mediate support for EU reform, we find no differences based on the level of EU knowledge. Yet, we do find clear differences based on Europeans’ overall scepticism about the EU. Regardless of whether people are sceptical about their country’s membership in the Union, the Euro, further political and economic integration, or the overall policy direction in the Union, sceptics differ primarily in their views about who ought to take decisions. In contrast to supporters, sceptics are much more opposed to a Union in which European actors make policy. The type of EU reform that sceptics most want to see is towards more national control, either by means of citizen referenda, in which national publics decide, or through national governments.

6. Next to more intergovernmental decision-making, sceptics also value an EU that regulates immigration more; some even prefer it to one that promotes economic growth.
Concluding Remarks

This report provides the first in-depth examination of public support for different EU reform proposals across member states; it also presents insight into Europeans' support of the EU and its policies. The findings lead to four conclusions. First, while regime support — captured through positive citizen preferences about membership, further political and economic integration, and in the Eurozone about the Euro — is high throughout the Union, satisfaction with the overall policy direction in the Union is not. Although in July 2015 Europeans by-and-large subscribe to the idea of a united Europe, they are worried about Brussels' overall policy direction. While EU citizens view the opening of borders and economic growth as the EU’s biggest achievements, they view peace and security and the fostering of economic growth as Europe’s biggest policy challenges. Those that are more opposed to the idea of the EU also view the regulation of immigration as a key policy challenge for that the EU. On the one hand, these findings are reassuring for proponents of the European project: even at a time of considerable economic and political turmoil in the Union, support for the EU is considerable. Yet, on the other hand, they give rise to concern. If the actions of elites fail to meet public expectations over a long period of time, a decrease in policy support for the EU may lead to a decrease in regime support and thus threaten the popular legitimacy of the project as a whole (see Scharpf 1999). Against this backdrop, it is crucial for the Union to undertake some kind of reform to meet citizen demand, especially when it comes to specific policies.

This leads us to the second conclusion, namely concerning the kind of change that citizens wish to see — and which could secure support for the Union in years to come. We find that while people are indifferent to raising the average annual contribution to €35 (compared to the current level of €0 per capita), they are not willing to pay much more than that. In terms of decision-making, they prefer citizen referenda. Of all of the EU actors, they prefer the European Parliament to take decisions, and are strongly opposed to the notion of an elected European President. In terms of size, they favour the status quo of 28 member states. And when it comes to policy, EU citizens prefer an EU that focuses on peace and security issues, and after that promotes economic growth.

Yet, we also find that key differences exist, especially between those who are more supportive versus those more sceptical about the EU. Regardless of people being sceptical about their country’s membership in the Union, the Euro, further political and economic integration or the overall policy direction in the Union, sceptics differ primarily in their views about who ought to take decisions in the Union. In contrast to supporters, sceptics are much more opposed to a Union in which EU actors decide on policy. The type of EU reform that sceptics most want to see is a move towards more national control, either by means of citizen referenda in which national publics decide or through national governments. Next to a more intergovernmental mode of decision making, sceptics also value an
EU that regulates immigration more, some even prefer it to one that promotes economic growth. The problem with catering to the preferences of sceptics is that it could alienate those who are supportive of the EU. For example, allowing more intergovernmental decision-making would foster support among those most critical, but at the same time it would most likely alienate younger generations of Europeans. Hence, simultaneously addressing the reform preferences of sceptics and supporters, of the young and the old, and of people from different regions may prove very difficult.

Yet, there are some reforms that could be implemented that would increase support among many groups throughout the EU. Interestingly, our results indicate that people care deeply about who governs them. We know from democratic theory that people do care about getting what they want, at least some of the time, in a representative democratic system like the EU. But they are also concerned about procedural aspects. In the words of the famous democratic theorist Robert Dahl (1989: 108): “each person should receive an […] equal chance to gain the scarce item”. In any representative system, the procedural aspect is particularly important as individuals rarely get everything they want in terms of policy outputs. What counts then is the belief that institutions provide a fair articulation of one’s interests. One reform that most people agree on in this context is that they would like to have the possibility to be directly included into the decision-making process via referenda. Given current challenges (making the Eurozone function properly, making the Schengen regime effective, etc.) several institutional reform options can be considered. Political scientist Simon Hix of the London School of Economics recently distinguished between minimalist and maximalist reform options. Minimalist reforms would require more scrutiny by national parliaments and oversight of the Euro Group by the European Parliament for example, while maximalist reforms could imply a series of referenda to ratify a new institutional architecture and the direct election of an EU President (Hix 2014). The findings presented here suggest that a maximalist reform option that involves referenda as a means to ratify a new institutional structure would most likely increase support, yet a direct election of an EU President might have the opposite effect. Hence, we could consider a middle option: the current institutional architecture could be reformed by giving national parliaments and the European Parliament more influence in many more aspects of fiscal and monetary cooperation, like approving austerity packages or any type of national reform that would be needed. In addition, we could more closely scrutinize the activities of the Council, Commission and Central Bank, all of which would need to be approved through a series of citizen referenda in all 28 member states, or at least within the Eurozone. When considering other steps in the integration process, soliciting citizen preferences through referenda may prove a useful means to foster support. This might be a fruitful way to give citizens the feeling that they are in control when it comes to what happens in Brussels.

A third and final conclusion is that the Eurozone crisis seems to have left a mark on public opinion. We find that contrary to findings in the past, citizens in Europe today, and especially those within the Eurozone, are more knowledgeable about the EU. Yet, this increased knowledge may not necessarily have led to more approval. While support for the EU as such is high, policy support is not. Hence, a more attentive citizenry makes it even more important for the EU to perform, not only in terms of outcomes but also in terms of procedures, the way in which decisions and policies are made. The idea attributed to the Europe’s founding father
Jean Monnet — that “Europe's nations should be guided towards the super-state without their people understanding what is happening. This can be accomplished by successive steps, each disguised as having an economic purpose, but which will eventually and irreversibly lead to federation” — is no longer realistic, if it ever was (Podmore 2008: 235). The Eurozone crisis has also put the question of German leadership in the Union at the forefront of public debate, especially in the South. In the southern member states, Germany’s role in the Union is deeply divisive with a majority of the populations there disapproving of it. The question will be how these perceptions will develop in the future. Given that the youngest generation (15- to 25-year-olds) favours a strong German role, perhaps we can be optimistic that the divisions created in the Eurozone crisis between creditor and debtor nations will not be long-lasting. Yet, crucially, this will depend on how the EU is able to cater to the demands of citizens both in the bailout-battered South and the richer North.

Fourth and finally, although the permissive consensus that characterized the Union until the 1990s is clearly over, some features of support remain today. The notion of the permissive consensus is the idea that elites decide where cooperation is most beneficial to securing peace and prosperity — and that citizens largely follow them. The latter is no longer true today: European citizens actively monitor the course of integration, and where necessary voice their fears and objections in referenda or European and national elections. Safeguarding peace and security, and promoting economic growth are the key policy goals that citizens wish the EU to focus on. Given the threats on Europe’s borders, be it the conflict in Ukraine or in the Middle East, the first sentence of the Schuman declaration drafted over six decades ago seems as appropriate as ever: “Peace cannot be safeguarded without the making of creative efforts proportionate to the dangers which threaten it.” Citizens in Europe, young and old, today and in the past, care deeply about securing peace and prosperity on the continent.
EUPINIONS WHAT DO THE PEOPLE WANT?

Data Collection Method: Programmatic Mobile Sampling

The data for this study was collected by Dalia Research. Dalia Research has developed a proprietary technology platform that gives researchers access to a network of over 30,000 widely used apps and mobile websites, covering all major content categories and guarantees broad access to all demographic groups, spread evenly across geographic regions. Through these apps and websites, respondents are randomly invited to join a live-panel via a direct communication on the (mobile) website or app. To avoid self-selection bias based on research topics, survey invitations are presented in a generic format without information on the specific content of a research project.

A potential respondent who receives an invitation and agrees to participate in a research study goes through a set of quick steps to assess basic demographic, targeting and behavioural attributes. These data are then used to create an anonymous user-profile and to "register" the respondent (or rather, the respondent's device) as a survey participant. During this process, the respondent is informed about the nature of the opinion research and explained that all information that the respondent provides will be recorded anonymously.

To ensure a high degree of data quality, a set of dynamic proprietary algorithms assess the trustability of a respondent by, for example, tracking user behaviour and profiles across metrics like completion times, answer consistency, response patterns and other metrics, including passive data observations, that correlate with data quality.

The surveys themselves are delivered through a fully responsive mobile web-interface with a low loading latency that provides consistent user-experience even in countries with slow internet connection.

In this EU Opinion survey, the number of total respondents in the EU is 12002.

As a certified corporate member of the World Association for Market, Social and Opinion Research (ESOMAR), Dalia Research complies with the ICC/ESOMAR International Code on Market and Social Research and strictly adheres to ISO Standards on market and opinion research, ESOMAR guidelines and the requirements of the Children's Online Privacy Act (COPPA). To guarantee a high degree of data-integrity and data-quality, Dalia Research does not store any Personally Identifiable Information (PII) on respondents.
List of Figures

**The Background: The Union Needs Reform But Will the European Public Support It?**

Our Method: A Conjoint Experiment Embedded in a Survey

| Table 1 | Conjoint experimental conditions |
| Table 2 | Dimensions, features and values for EU Reform conjoint experiment |

**Part I: What Is the Mood in Europe About Europe?**

- Figure 1 Knowledge about the EU is high
- Figure 2 Knowledge about the EU is higher in Eurozone countries
- Figure 3 Knowledge about the EU is lowest in north non-Eurozone region
- Figure 4 The share of people with low knowledge about the EU is Greatest in Great Britain
- Figure 5.1 Most people know president Obama and chancellor Merkel
- Figure 5.2 More people know top EU officials than prime minister Renzi or Rajoy
- Figure 6.1 Most people know President Obama and chancellor Merkel
- Figure 6.2 Many differences in name recognition of Draghi and Dijsselbloem between Eurozone and non-Eurozone
- Figure 7 Name recognition of EU officials

**Membership and Euro Support**

- Figure 8 Membership support is high
- Figure 9 Support for membership is equally high in Eurozone vs non-Eurozone countries
- Figure 10 Support for membership is lowest in north non-Eurozone region
- Figure 11 Support for membership lowest in Great Britain and Italy
- Figure 12.1 Divided support for the Euro in EU28
- Figure 12.2 Support for Euro in Eurozone countries, opposition in non-Eurozone countries
- Figure 13 Opposition to Euro greatest in north non-Eurozone
- Figure 14 Support for Euro greatest in Spain, opposition to Euro greatest in Great Britain

**Support for Further Political and Economic Integration in Europe**

- Figure 15 Within the EU28 people prefer more political and economic integration
- Figure 16 Support for more political and economic integration slightly greater in Eurozone
- Figure 17 Support for more political and economic integration greatest in Italy and Spain, weakest in Great Britain
- Figure 18 Support for more political and economic integration, greatest in Italy and Spain, weakest in Great Britain

**The Biggest Policy Achievements and Policy Needs in Europe**

- Figure 19.1 Opening borders and intra-EU trade are seen as Europe’s biggest achievements in EU28
- Figure 19.2 Security and growth are seen as Europe’s most pressing policy needs in EU28
- Figure 20.1 Opening borders Europe’s biggest achievements in non-Eurozone, while trade in Eurozone
- Figure 20.2 Not many differences in EU’s pressing policy priorities in Eurozone versus non-Eurozone members
- Figure 21.1 EU’s biggest achievements
- Figure 21.2 EU’s most pressing policy priorities

**Views about the Direction the EU and the Country are Moving**

- Figure 22 Within the EU28 people view that both the EU and their country are moving in the wrong direction
- Figure 23 people more sceptical about EU and national policy direction in Eurozone countries
- Figure 24 In the South people are the most sceptical about policy direction in the EU and their own country
- Figure 25 In the South people are most sceptical about policy direction in the EU and their own country

**How to Talk to Friends about the Union**

- Figure 26 People equally likely to talk positively as negatively about the EU to friends
- Figure 27 No big differences between Eurozone and non-Eurozone countries
- Figure 28 People are more positive about the EU in north Eurozone and East
- Figure 29 Britons, French and Italians least positive about the EU
German Leadership in the Union

- Figure 30: In the EU28, a majority views Germany's leadership in the Union as good.
- Figure 31: Approval of Germany's leadership in the Union is higher in non-Eurozone.
- Figure 32: Approval of Germany's leadership in the Union is low in the South.
- Table 3: Oldest and youngest generation in the South most positive about German leadership in the Union.
- Figure 33: Approval of Germany's leadership in the Union is lowest in Italy and Spain.
